

# Package: pubrplot (via r-universe)

May 15, 2026

**Type** Package

**Title** Publication-Ready Plots and Statistical Visualizations

**Version** 0.0.1

**Description** Provides functions to create high-quality, publication-ready plots for numeric and categorical data, including bar plots, violin plots, boxplots, line plots, error bars, correlation plots, linear model plots, odds ratio plots, and normality plots.

**License** MIT + file LICENSE

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Imports** ggplot2, dplyr, ggthemes, rlang, broom, tidyr, rstatix, purrr, tibble

**Config/pak/sysreqs** cmake make libicu-dev

**Repository** <https://umarhussain-git.r-universe.dev>

**Date/Publication** 2025-12-09 09:18:31 UTC

**RemoteUrl** <https://github.com/umarhussain-git/pubrplot>

**RemoteRef** HEAD

**RemoteSha** e0ad8089a61c6e2d0126b121834a4b5548849437

plot\_bar

*Bar Plot for Categorical Data with Optional Grouping***Description**

Creates a publication-quality bar plot for a categorical variable, with optional grouping by another variable. Automatically calculates counts and percentages and can display them on the bars. Also performs Chi-square or Fisher exact test if `by` is provided.

**Usage**

```
plot_bar(
  data,
  var,
  by = NULL,
  vjust = -0.3,
  hjust = 0.5,
  axis.label.angle = 45,
  label = NULL,
  border.color = NULL,
  label.color = "black",
  x.lab = "Group",
  y.lab = "Percentage (%)",
  fill.lab = "Variable",
  text.size = 3,
  color.bar = NULL,
  theme_fun = ggthemes::theme_stata,
  bar.width = 0.8,
  y.expand = 1.12
)
```

**Arguments**

<code>data</code>	A data frame containing the variables to plot.
<code>var</code>	The main categorical variable to display on the x-axis (unquoted or quoted).
<code>by</code>	Optional grouping variable for stacked/dodged bars (unquoted or quoted). Default is <code>NULL</code> .
<code>vjust</code>	Vertical adjustment for text labels. Default is <code>-0.3</code> .
<code>hjust</code>	Horizontal adjustment for text labels. Default is <code>0.5</code> .
<code>axis.label.angle</code>	Angle of x-axis labels. Default is <code>45</code> .
<code>label</code>	Optional custom labels for factor levels of <code>var</code> .
<code>border.color</code>	Optional color for bar borders. Default is <code>NULL</code> .
<code>label.color</code>	Color of the text labels on bars. Default is <code>"black"</code> .

<code>x.lab</code>	Label for x-axis. Default is "Group".
<code>y.lab</code>	Label for y-axis. Default is "Percentage (%)".
<code>fill.lab</code>	Legend title for the fill variable. Default is "Variable".
<code>text.size</code>	Size of the text labels. Default is 3.
<code>color.bar</code>	Optional vector of colors for bars.
<code>theme_fun</code>	Theme function from ggthemes (or ggplot2) for styling. Default is <code>ggthemes::theme_stata</code> .
<code>bar.width</code>	Width of the bars. Default is 0.8.
<code>y.expand</code>	Factor to expand the y-axis for space above the highest bar. Default is 1.12.

## Value

A `ggplot2` object representing the bar plot.

## Examples

```
# Example using CO2 dataset
plot_bar(
  CO2,
  var = "Type",
  by = "Treatment",
  fill.lab = "Plant Type",
  color.bar = c("lightblue", "lightgreen"),
  border.color = "black",
  bar.width = 0.5,
  text.size = 3,
  label = c("Quebec", "Mississippi")
)

# Example using diamonds dataset
plot_bar(
  ggplot2::diamonds,
  var = "cut",
  by = "color",
  y.lab = "Distribution (%)",
  fill.lab = "Cut",
  text.size = 2,
  bar.width = 0.9,
  color.bar = c("#a465db", "steelblue", "darkgreen", "darkred", "#fcba03")
)

# Simple bar plot without grouping
plot_bar(ggplot2::diamonds, var = "cut")
```

---

`plot_cor`*Correlation Heatmap Plot*

---

## Description

Creates a publication-ready correlation heatmap for numeric variables in a data frame. Each tile shows the correlation coefficient, with optional significance stars.

## Usage

```
plot_cor(  
  data,  
  method = "pearson",  
  conf.level = 0.95,  
  stars = TRUE,  
  plot.title = NULL,  
  var.labels = NULL  
)
```

## Arguments

<code>data</code>	A data frame containing numeric variables to correlate.
<code>method</code>	Correlation method: "pearson", "spearman", or "kendall". Default is "pearson".
<code>conf.level</code>	Confidence level for correlation confidence intervals. Default is 0.95.
<code>stars</code>	Logical. If TRUE, adds significance stars based on p-values. Default is TRUE.
<code>plot.title</code>	Character string specifying the plot title. If NULL, a default title is used.
<code>var.labels</code>	Optional character vector of variable labels to replace column names in the plot. Must match number of numeric columns.

## Value

A ggplot object showing the correlation heatmap with correlation coefficients and significance stars.

## Examples

```
plot_cor(mtcars)  
plot_cor(mtcars, var.labels = colnames(mtcars))  
plot_cor(mtcars, method = "spearman", stars = FALSE)
```

---

plot\_errorbar                      *Plot Mean with Error Bars*

---

## Description

This function creates a line plot with points and customizable error bars (standard deviation, standard error, or confidence interval) for a numeric variable grouped by a categorical variable. Mean values can optionally be displayed above the points.

## Usage

```
plot_errorbar(  
  data,  
  var,  
  by,  
  error = c("sd", "se", "ci"),  
  err.mult = 1.5,  
  point.shape = 19,  
  point.size = 3,  
  line.color = "blue",  
  line.size = 1,  
  color.point = "black",  
  color.error = "black",  
  show.mean = TRUE,  
  text.size = 3.5,  
  err.width = 0.05,  
  x.lab = "Group",  
  y.lab = NULL,  
  title = NULL,  
  rotate = FALSE,  
  theme_fun = ggthemes::theme_stata  
)
```

## Arguments

<code>data</code>	A data frame containing the variables to plot.
<code>var</code>	A numeric variable to be summarized and plotted.
<code>by</code>	A grouping (categorical) variable to calculate summary statistics by.
<code>error</code>	Type of error to display: "sd" (standard deviation), "se" (standard error), or "ci" (95% confidence interval). Default is "sd".
<code>err.mult</code>	Numeric multiplier for the error bars. Useful to extend or shrink error bars. Default is 1.5.
<code>point.shape</code>	Shape of the points. Default is 19 (solid circle).
<code>point.size</code>	Size of the points. Default is 3.
<code>line.color</code>	Color of the connecting line. Default is "blue".

<code>line.size</code>	Thickness of the connecting line. Default is 1.
<code>color.point</code>	Color of the points. Default is "black".
<code>color.error</code>	Color of the error bars. Default is "black".
<code>show.mean</code>	Logical; if TRUE, mean values are displayed above points. Default is TRUE.
<code>text.size</code>	Size of the mean value text labels. Default is 3.5.
<code>err.width</code>	Width of the error bars (horizontal whiskers). Default is 0.05.
<code>x.lab</code>	Label for the x-axis. Default is "Group".
<code>y.lab</code>	Label for the y-axis. If NULL, uses the name of <code>var</code> .
<code>title</code>	Plot title. Default is NULL.
<code>rotate</code>	Logical; if TRUE, rotates x-axis labels by 45 degrees. Default is FALSE.
<code>theme_fun</code>	ggplot2 theme function to customize the plot appearance. Default is <code>ggthemes::theme_stata</code> .

### Value

A ggplot2 object displaying the line plot with points and error bars.

### Examples

```
plot_errorbar(
  data = iris,
  var = Sepal.Length,
  by = Species,
  error = "se",
  err.mult = 1,
  point.shape = 19,
  point.size = 3,
  line.color = "red",
  line.size = 0.5,
  color.point = "blue",
  color.error = "blue",
  show.mean = TRUE,
  text.size = 3,
  err.width = 0.05,
  title = "Mean Sepal Length by Species",
  rotate = TRUE
)
```

---

plot\_line

*Line Plot with Error Bars by Group and Time*

---

### Description

This function creates a line plot showing the mean of a numeric variable over time for different groups, with optional error bars (standard deviation, standard error, or 95% confidence interval). Multiple groups are displayed on the same plot with customizable colors, point shapes, and line thickness.

**Usage**

```
plot_line(
  data,
  var,
  time,
  group,
  error = c("sd", "se", "ci"),
  err.mult = 1.5,
  point.shape = 19,
  point.size = 3,
  line.size = 1,
  color.lines = c("red", "blue"),
  show.mean = FALSE,
  text.size = 3.5,
  err.width = 0.05,
  x.lab = "Time",
  y.lab = NULL,
  title = NULL,
  theme_fun = ggthemes::theme_stata
)
```

**Arguments**

<code>data</code>	A data frame containing the variables to plot.
<code>var</code>	A numeric variable to summarize and plot.
<code>time</code>	A variable representing time points (x-axis). Converted to factor if not already.
<code>group</code>	A grouping variable (color/line grouping) for the plot.
<code>error</code>	Type of error to display: "sd" (standard deviation), "se" (standard error), or "ci" (95% confidence interval). Default is "sd".
<code>err.mult</code>	Numeric multiplier for the error bars. Default is 1.5.
<code>point.shape</code>	Shape of the points. Default is 19 (solid circle).
<code>point.size</code>	Size of the points. Default is 3.
<code>line.size</code>	Thickness of the lines. Default is 1.
<code>color.lines</code>	Vector of colors for the lines/groups. Default is c("red", "blue").
<code>show.mean</code>	Logical; if TRUE, mean values can optionally be displayed above points. Default is FALSE.
<code>text.size</code>	Size of mean value text labels (if <code>show.mean = TRUE</code> ). Default is 3.5.
<code>err.width</code>	Width of the error bars. Default is 0.05.
<code>x.lab</code>	Label for the x-axis. Default is "Time".
<code>y.lab</code>	Label for the y-axis. If NULL, uses the name of <code>var</code> .
<code>title</code>	Plot title. Default is NULL.
<code>theme_fun</code>	ggplot2 theme function to customize plot appearance. Default is <code>ggthemes::theme_stata</code> .

## Value

A ggplot object displaying the line plot with optional error bars for multiple groups.

## Examples

```
set.seed(123)
n_subj <- 10
time_points <- c("T1","T2","T3")
groups <- c("DrugA","DrugB")

df <- expand.grid(
  id = 1:n_subj,
  time = time_points,
  group = groups
)

# Arrange by group, id, time
df <- dplyr::arrange(df, group, id, time)

# Add BMI column
df <- dplyr::mutate(df,
  BMI = dplyr::case_when(
    time == "T1" & group == "DrugA" ~ 29 + stats::rnorm(dplyr::n(), 0, 0.3),
    time == "T2" & group == "DrugA" ~ 26 + stats::rnorm(dplyr::n(), 0, 0.3),
    time == "T3" & group == "DrugA" ~ 22 + stats::rnorm(dplyr::n(), 0, 0.3),
    time == "T1" & group == "DrugB" ~ 28 + stats::rnorm(dplyr::n(), 0, 0.3),
    time == "T2" & group == "DrugB" ~ 25 + stats::rnorm(dplyr::n(), 0, 0.2),
    time == "T3" & group == "DrugB" ~ 21 + stats::rnorm(dplyr::n(), 0, 0.2)
  )
)
```

---

plot\_lm

*Plot Linear Regression Estimates with Confidence Intervals*

---

## Description

This function fits univariate and multivariate linear regression models for a given outcome and a set of predictors. It returns a ggplot showing point estimates and 95% confidence intervals for each predictor. Reference levels of factors can optionally be added, and univariate and multivariate results are plotted side by side.

## Usage

```
plot_lm(
  data,
  outcome,
  predictors,
  label_vjust = -0.8,
  label_hjust = 0.4,
```

```

    label_size = 3.5,
    label_color = "black",
    point_color = c("steelblue", "firebrick"),
    point_shape = 15,
    ref = TRUE
  )

```

## Arguments

<code>data</code>	A data frame containing the outcome and predictor variables.
<code>outcome</code>	A string specifying the outcome (dependent) variable.
<code>predictors</code>	A character vector of predictor (independent) variables.
<code>label_vjust</code>	Vertical adjustment for text labels. Default is -0.8.
<code>label_hjust</code>	Horizontal adjustment for text labels. Default is 0.4.
<code>label_size</code>	Size of text labels. Default is 3.5.
<code>label_color</code>	Color of text labels. Default is "black".
<code>point_color</code>	Vector of colors for the points. Default is c("steelblue", "firebrick").
<code>point_shape</code>	Shape of the points. Default is 15.
<code>ref</code>	Logical; if TRUE, adds reference levels for factor variables. Default is TRUE.

## Value

A `ggplot` object showing regression estimates with 95% confidence intervals for both univariate and multivariate models. @import broom

## Examples

```

mtcars2 <- dplyr::mutate(
  mtcars,
  cyl = factor(cyl),
  am = factor(am, labels = c("Automatic", "Manual")),
  gear = factor(gear)
)

plot_lm(
  data = mtcars2,
  outcome = "mpg",
  predictors = c("cyl", "hp", "wt", "am", "gear"),
  point_shape = 18
)

plot_lm(
  data = mtcars2,
  outcome = "mpg",
  predictors = c("cyl", "hp", "wt", "am", "gear"),
  point_shape = 18
)

```

---

plot_norm	<i>Normality Assessment Plot with Shapiro-Wilk and Kolmogorov-Smirnov Tests</i>
-----------	---

---

## Description

This function visualizes the distribution of multiple numeric variables using boxplots or histograms with overlaid normal distribution curves. It automatically selects the appropriate normality test based on sample size: the Shapiro-Wilk test is applied when sample size is  $\leq 5000$ , while the Kolmogorov-Smirnov test is used for larger samples ( $> 5000$ ). The resulting p-values are displayed directly on the plots.

## Usage

```
plot_norm(  
  data,  
  vars,  
  geom = c("box", "hist"),  
  color_bar = "#377eb8",  
  color_line = "darkred",  
  xlab = NULL,  
  ylab = NULL,  
  bins = 20,  
  label_color = "black",  
  label_size = 3.5,  
  label_vjust = 0,  
  label_hjust = 0,  
  alpha_bar = 0.5,  
  sample_size = 5000,  
  label_fraction = 0.05,  
  position = NULL,  
  p.ypos = NULL  
)
```

## Arguments

<b>data</b>	A data frame containing the variables to be tested and plotted.
<b>vars</b>	A character vector of column names (numeric variables) to be assessed for normality.
<b>geom</b>	Character string specifying the plot type. Options are "box" for boxplots and "hist" for histograms with normal curves.
<b>color_bar</b>	Fill color for boxplots or histograms.
<b>color_line</b>	Color of the normal distribution curve (only used for histograms).
<b>xlab</b>	X-axis label.
<b>ylab</b>	Y-axis label.

<code>bins</code>	Number of bins used in histograms.
<code>label_color</code>	Color of the normality test p-value text labels.
<code>label_size</code>	Numeric size of the p-value text labels.
<code>label_vjust</code>	Vertical justification of the p-value labels.
<code>label_hjust</code>	Horizontal justification of the p-value labels.
<code>alpha_bar</code>	Transparency level for boxplots or histogram bars.
<code>sample_size</code>	Maximum sample size used for the normality test. When the total sample size exceeds 5000, the Kolmogorov–Smirnov test is applied automatically.
<code>label_fraction</code>	Fraction of plot height used to automatically position p-value labels.
<code>position</code>	Optional named list of manual (x, y) positions for p-value placement per variable.
<code>p.ypos</code>	Optional numeric value or named list to override automatic y-positions for p-values.

### Value

A `ggplot` object displaying the selected normality plots with test p-values.

### Examples

```
## Load example dataset safely
data(diamonds, package = "ggplot2")
## Example 1: Boxplots with Shapiro-Wilk test (n <= 5000)
plot_norm(
  data = diamonds[1:4000, ],
  vars = c("carat", "x", "y"),
  geom = "box"
)

## Example 2: Histograms with Shapiro-Wilk test (n <= 5000)
plot_norm(
  data = diamonds[1:4000, ],
  vars = c("carat", "x", "y"),
  geom = "hist",
  bins = 20,
  p.ypos = 0.6
)

## Example 3: Kolmogorov-Smirnov test automatically applied (n > 5000)
plot_norm(
  data = diamonds[1:6000, ],
  vars = c("carat", "x"),
  geom = "hist",
  bins = 25
)

## Example 4: CO2 dataset (base R)
plot_norm(
```

```

data = CO2,
vars = c("uptake", "conc"),
geom = "hist",
bins = 3
)

```

---

plot_numeric	<i>Publication-Quality Numeric Plot with Optional Grouping and Statistical Tests</i>
--------------	--

---

## Description

Creates a publication-ready plot for numeric variables, including bar plots, violin plots, boxplots, and combinations (violin + box, violin + jitter, box + jitter). Supports error bars (SD, SE, CI), group comparisons, and automatic or specified statistical tests with optional post-hoc annotations.

## Usage

```

plot_numeric(
  data,
  var,
  by,
  geom_type = c("bar", "violin", "box", "violin_box", "violin_jitter", "box_jitter"),
  error = c("sd", "se", "ci"),
  test.type = c("auto", "parametric", "nonparametric"),
  vjust = 0,
  rotate = FALSE,
  x.lab = "Group",
  y.lab = NULL,
  text.size = 3.5,
  color.violin = NULL,
  color.box = NULL,
  box.color = "black",
  color.jitter = "black",
  jitter.size = 1.5,
  ptext.size = 3,
  theme_fun = ggthemes::theme_stata,
  bar.width = 0.85,
  box.width = 0.2,
  show.posthoc = TRUE,
  err.mult = 1.5,
  position.p = NULL,
  jitter.width = 0.1
)

```

**Arguments**

<code>data</code>	A data frame containing the variables to plot.
<code>var</code>	Numeric variable to plot (unquoted).
<code>by</code>	Optional grouping variable (unquoted) to create separate groups.
<code>geom_type</code>	Type of plot: "bar", "violin", "box", "violin_box", "violin_jitter", "box_jitter".
<code>error</code>	Type of error to display for bar plots: "sd", "se", or "ci".
<code>test.type</code>	Statistical test type: "auto", "parametric", or "nonparametric".
<code>vjust</code>	Vertical adjustment for text labels. Default is 0.
<code>rotate</code>	Logical, whether to rotate x-axis labels. Default is FALSE.
<code>x.lab</code>	Label for x-axis. Default is "Group".
<code>y.lab</code>	Label for y-axis. Defaults to variable name.
<code>text.size</code>	Size of labels above bars or violin/box plots. Default is 3.5.
<code>color.violin</code>	Fill color for violin plots. Can be a vector of colors per group.
<code>color.box</code>	Fill color for boxplots inside violins. Can be a vector of colors per group.
<code>box.color</code>	Outline color for boxplots. Default is "black".
<code>color.jitter</code>	Color of jittered points. Default is "black".
<code>jitter.size</code>	Size of jittered points. Default is 1.5.
<code>ptext.size</code>	Size of text for post-hoc annotations. Default is 3.
<code>theme_fun</code>	Theme function from <code>ggthemes</code> or <code>ggplot2</code> for styling. Default is <code>ggthemes::theme_stata</code> .
<code>bar.width</code>	Width of bars for bar plots. Default is 0.85.
<code>box.width</code>	Width of boxplots inside violin. Default is 0.2.
<code>show.posthoc</code>	Logical, whether to display post-hoc test results. Default is TRUE.
<code>err.mult</code>	Multiplier for error bars (SD/SE/CI). Default is 1.5.
<code>position.p</code>	Optional vector <code>c(x, y)</code> to place post-hoc text manually.
<code>jitter.width</code>	Width of jitter for points in <code>violin_jitter</code> or <code>box_jitter</code> plots. Default is 0.1.

**Value**

A `ggplot2` object representing the numeric variable plot.

**Examples**

```
# Violin + Box plot for iris dataset
plot_numeric(
  data = iris,
  var = Sepal.Length,
  by = Species,
  geom_type = "violin_box",
  box.width = 0.1,
  color.violin = c("#377eb8", "#ff7f00", "#4daf4a"),
  color.box = c("darkgreen", "#a65628", "#f781bf"),
```

```
    box.color = "black",
    color.jitter = "red",
    position.p = c(1,9),
    jitter.size = 2,
    ptext.size = 4,
    show.posthoc = TRUE
)

# Simple bar plot with error bars
plot_numeric(
  data = iris,
  var = Sepal.Length,
  by = Species,
  geom_type = "bar",
  error = "se"
)

# Violin plot with jitter points
plot_numeric(
  data = iris,
  var = Sepal.Length,
  by = Species,
  geom_type = "violin_jitter"
)
```

---

plot\_or

*Plot Odds Ratios from Logistic Regression*

---

## Description

This function fits univariate and multivariate logistic regression models and plots odds ratios with 95% confidence intervals. Reference levels can optionally be displayed.

## Usage

```
plot_or(
  data,
  outcome,
  predictors,
  label_vjust = -0.8,
  label_hjust = 0.5,
  label_size = 3.5,
  label_color = "black",
  point_color = c("steelblue", "firebrick"),
  ref = TRUE
)
```

**Arguments**

<code>data</code>	A data frame containing the outcome and predictors.
<code>outcome</code>	Name of the binary outcome variable (as string).
<code>predictors</code>	Vector of predictor variable names (as strings).
<code>label_vjust</code>	Vertical adjustment for labels (default -0.8).
<code>label_hjust</code>	Horizontal adjustment for labels (default 0.5).
<code>label_size</code>	Size of the text labels (default 3.5).
<code>label_color</code>	Color of the text labels (default "black").
<code>point_color</code>	Colors for points corresponding to univariate and multivariate models (default <code>c("steelblue", "firebrick")</code> ).
<code>ref</code>	Logical, whether to show reference levels (default TRUE).

**Value**

A ggplot object showing odds ratios with confidence intervals.

**Examples**

```
# Load built-in infertility dataset
infert1 <- datasets::infert
infert1$case <- factor(infert1$case, levels = c(0,1), labels = c("Control","Infertile"))
infert1$induced <- factor(infert1$induced, levels = c(0,1), labels = c("No","Yes"))
infert1$spontaneous <- factor(infert1$spontaneous, levels = c(0,1), labels = c("No","Yes"))

# Plot with reference levels
plot_or(
  data = infert1,
  outcome = "case",
  predictors = c("parity","induced","spontaneous","age"),
  ref = TRUE
)

# Plot without reference levels
plot_or(
  data = infert1,
  outcome = "case",
  predictors = c("parity","induced","spontaneous","age"),
  ref = FALSE
)
```

---

plot\_scatter

*Scatter Plot with Linear Regression and Equation Annotation*

---

**Description**

This function creates a scatter plot of a numeric outcome against a numeric predictor, optionally grouped by a factor (`by`). A linear regression line is added with optional standard error (SE) shading, and the regression equation and  $R^2$  value are displayed on the plot.

**Usage**

```
plot_scatter(
  data,
  outcome,
  predictor,
  by = NULL,
  point_color = "#377eb8",
  line_color = "#e41a1c",
  se_fill = "#e41a1c55",
  line_size = 1,
  se = TRUE,
  facet_scales = "free",
  eq_position = c(0.05, 0.95),
  ncol_by = NULL
)
```

**Arguments**

<code>data</code>	A data frame containing the variables to plot.
<code>outcome</code>	Character string. Name of the numeric outcome variable.
<code>predictor</code>	Character string. Name of the numeric predictor variable.
<code>by</code>	Character string, optional. Name of a factor variable for grouping/faceting.
<code>point_color</code>	Color for the scatter plot points (default: "#377eb8").
<code>line_color</code>	Color for the regression line (default: "#e41a1c").
<code>se_fill</code>	Fill color for the confidence interval shading around the regression line (default: "#e41a1c55").
<code>line_size</code>	Numeric. Line width for the regression line (default: 1).
<code>se</code>	Logical. Whether to display the standard error shading around the regression line (default: TRUE).
<code>facet_scales</code>	Character. Scales argument for <code>facet_wrap</code> ("free", "fixed", "free_x", "free_y") (default: "free").
<code>eq_position</code>	Numeric vector of length 2. Relative position of regression equation on the plot: <code>c(x_pos, y_pos)</code> (default: <code>c(0.05, 0.95)</code> ).
<code>ncol_by</code>	Numeric. Number of columns for faceting (passed to <code>facet_wrap</code> ) (default: NULL, automatic).

**Value**

A ggplot2 object of the scatter plot with regression line and annotated equation.

**Examples**

```
# Basic scatter plot with regression line and equation
plot_scatter(mtcars, "mpg", "wt")

# Scatter plot grouped by cylinder
```

```
plot_scatter(mtcars, "mpg", "wt", by = "cyl",  
             point_color = "blue",
